

AUTOMATION

Utilising automation technology at car parks is becoming an increasingly popular way to achieve labour cost reductions, extend car park trading hours and improve customer service and audit delivery.

Care Park operates a large number of car parks utilising automation technology in various environments such as shopping centres, airports, corporate profile buildings and public car parks.

HOW AUTOMATION WORKS

All customers entering the car park stop and take a ticket from, or swipe an access card at, an entry station, allowing the boom gate to raise and the vehicle to gain access to the car park.

Before leaving the car park, customers visit an Auto Pay Station, insert or scan their ticket and pay the applicable

fee. The pay station generates an exit pass after payment is processed.

To exit, customers insert or scan their ticket at an exit station, or swipe an access card, to allow the boom gate to raise for exit.

An automated system operates with entry ticket dispensers, boom gates, exit stations with credit card payment facilities, Auto Pay Stations for payment and validation, central computer operating systems and intercom and CCTV coverage of all paystations and entry and exit points.
